# Breaking The FF3 FormatPreserving Encryption Standard Over Small Domains 

F. Betül Durak

Serge Vaudenay

## Block Ciphers

## Block Ciphers

Strict with specific domains: bit-strings of length 128.

Format-Preserving Encryption (FPE) [Brightwell and Smith, 1997], [Black and Rogaway, 2002], [Spies'08],[BRRS'09],...

Format-Preserving Encryption (FPE) [Brightwell and Smith, 1997], [Black and Rogaway, 2002], [Spies'08],[BRRS'09],...

Legacy databases:

- Passcodes
- Social security numbers (SSN) IDI $\approx 2^{30}$
- Credit card numbers (CCN) IDI $\approx{ }^{51}$

## FPE in Practice: Encrypted Databases

| Patients | Passcode | SSN |
| :---: | :---: | :---: |
| Alice Yan | 2356 | $34-582-9381$ |
| Bob Wu | 4567 | $75-682-8345$ |
| $\ldots$ | $\ldots$ | $\ldots$ |
| Sam Xi | 9056 | $26-734-2108$ |

## FPE in Practice: Encrypted Databases

| Patients | Passcodes | SSNs |
| :---: | :---: | :---: |
| Alice Yan | XXXx | XXXXX-9381 |
| Bob Wu | XXXX | XXXXX-8345 |
| $\ldots$ | $\ldots$ | $\ldots$ |
| Sam Xi | XXXX | XXXXX-2108 |

- Transparent encryption in legacy databases.

## Main FPE Challenge: Domain Mismatch

## Main FPE Challenge: Domain Mismatch

## FPE Constructions

- Provably secure [HMR'12, RY'13, MR'14] -Not fast enough to use in practice.

## FPE Constructions

- Provably secure [HMR'12, RY'13, MR'14]
- Not fast enough to use in practice.
- NIST Special Publications 800-38G:
- Practical [BRS (FF1), V (FF2), BPS (FF3)]
- Security by cryptanalysis (Voilà!).
- FF1 and FF3 (somewhat balanced Feistel).

## Feistel Network (1973)

An instance of (balanced) Feistel network on domain D2

## Feistel Network (1973)

An instance of (balanced) Feistel network on domain D2

## Feistel Network (1973)

An instance of (balanced) Feistel network on domain D2

## Tweakable Format Preserving Encryption

$\operatorname{Pr}\left[\mathrm{P}_{1}=\mathrm{P}_{2}\right]$ is high with small domains, hence $\mathrm{C}_{1}=\mathrm{C}_{2}$

## Tweakable Format Preserving Encryption

When $P_{1}=P_{2}$ and $T_{1} \neq T_{2}, C_{1} \neq C_{2}$

## Feistel Networks in FF3

FPE: An encryption scheme on domain $\mathbb{Z}_{N} \times \mathbb{Z}_{N}$ (i.e, domain size is $N^{2}$ ) when $N$ is really small, typically defined as $N \ll 2^{128}$

Feistel Networks in FF3

FPE: An encryption scheme on domain $\mathbb{Z}_{N} \times \mathbb{Z}_{N}$ (i.e, domain size is $N^{2}$ ) when $N$ is really small, typically defined as $N \ll 2^{128}$

Feistel Networks in FF3

FPE: An encryption scheme on domain $\mathbb{Z}_{N} \times \mathbb{Z}_{N}$ (i.e, domain size is $N^{2}$ ) when $N$ is really small, typically defined as $N \ll 22^{128}$

The secret key and tweaks are dropped in notation from now on.

## NIST Standard SP-800-38G (2016): FF3

- Round number $r=8$ for FF3 ( $r=10$ for FF1).
- Domain size is at least 100.
- Security:
- Targeted security is 128-bit.
- Security of Feistel networks inherits to FF3.
- FF3 asserts chosen-plaintext security and even PRP security against chosen-plaintext/-ciphertext attack.

## Our Contributions (Briefly)

Part 1: We develop a new generic attack on Feistel networks.

## Our Contributions (Briefly)

Part 1: We develop a new generic attack on Feistel networks.
Part 2: We give a total practical break to FF3 standard when the message domain is small.

## Our Contributions (Briefly)

Part 1: We develop a new generic attack on Feistel networks.
Part 2: We give a total practical break to FF3 standard when the message domain is small.

- Our attack works with the best known query and time complexity.

## Our Contributions (Briefly)

Part 1: We develop a new generic attack on Feistel networks.
Part 2: We give a total practical break to FF3 standard when the message domain is small.

- Our attack works with the best known query and time complexity.
- It is easy fix in order to prevent it from present attack.

## Equivalent Round Functions [BLP'15]

Are the round functions uniquely defined to encrypt messages?

## Equivalent Round Functions [BLP'15]

Are the round functions uniquely defined to encrypt messages?

## Equivalent Round Functions [BLP'15]

Are the round functions uniquely defined to encrypt messages?

## Equivalent Round Functions [BLP'15]

Are the round functions uniquely defined to encrypt messages?

## Equivalent Round Functions [BLP'15]

Are the round functions uniquely defined to encrypt messages?

## Equivalent Round Functions [BLP'15]

Are the round functions uniquely defined to encrypt messages?

## Equivalent Round Functions [BLP'15]

Are the round functions uniquely defined to encrypt messages?

$$
\begin{aligned}
& y \longrightarrow F_{0} \stackrel{+\delta}{\downarrow} \stackrel{x}{\downarrow}+c+\delta \\
& c+\delta \xrightarrow{-\delta} \stackrel{F_{1}}{\rightarrow} \stackrel{y}{\downarrow}
\end{aligned}
$$

## Equivalent Round Functions [BLP'15]

Are the round functions uniquely defined to encrypt messages?

$\left(F_{0}, F_{1}, F_{2}\right)$

## Equivalent Round Functions [BLP'15]

Are the round functions uniquely defined to encrypt messages?

$\left(F_{0}, F_{1}, F_{2}\right)$

$$
c+\delta \stackrel{-\delta}{\downarrow} \xrightarrow{F_{1}} \longrightarrow \stackrel{\begin{array}{c}
y \\
\downarrow
\end{array}}{\rightarrow} t
$$

$$
t \longrightarrow \stackrel{F_{2}}{ } \xrightarrow{-\delta} \stackrel{c}{\downarrow} \xrightarrow{\downarrow} z
$$

$$
\left(F_{0}(y)+\delta, F_{1}(c-\delta), F_{2}(t)-\delta\right)
$$

The output of one arbitrary input y can be set arbitrarily in $\mathrm{F}_{0}$, yet it still gives the same input/output behavior of $\left(F_{0}, F_{1}, F_{2}\right)$.

## Terminology

-attacker goal:

- round-function-recovery: The adversary recovers the round functions or one of the equivalent set of round functions in a Feistel network.
- codebook-recovery: The adversary can recover the mapping of each plaintext to its ciphertext.
- Both attack goals are as powerful as secret key recovery.

## Our Contributions, Part 1:

## 3-round Attack on Feistel Networks

input: The set $S$ that consists of ( $\mathrm{X}_{\mathrm{k}} \mathrm{y}_{\mathrm{k}} \mathrm{Z}_{\mathrm{k}} \mathrm{t}_{\mathrm{k}}$ ) pairs.

- Model the set $S$ as a bipartite graph:
- vertices: two parties of $N$ values of all possible $\mathbf{y}$ and $\mathbf{t}$.
- edges: each (xyzt) pair from pairs in $S$ that forms an edge.

## 3-round Attack on Feistel Networks

input: The set $S$ that consists of ( $\mathrm{X}_{\mathrm{k}} \mathrm{y}_{\mathrm{k}} \mathrm{Z}_{\mathrm{k}} \mathrm{t}_{\mathrm{k}}$ ) pairs.

- Model the set $S$ as a bipartite graph:
- vertices: two parties of $N$ values of all possible $\mathbf{y}$ and $\mathbf{t}$.
- edges: each ( $x \mathbf{y} z \mathbf{t}$ ) pair from pairs in $S$ that forms an edge.
- The algorithm looks for the connected component starting from an arbitrary vertex yo that the algorithm starts with.

## 3-round Attack on Feistel Networks

input: The set $S$ that consists of ( $\mathrm{X}_{\mathrm{k}} \mathrm{y}_{\mathrm{k}} \mathrm{Z}_{\mathrm{k}} \mathrm{t}_{\mathrm{k}}$ ) pairs.

- Model the set $S$ as a bipartite graph:
- vertices: two parties of $N$ values of all possible $\mathbf{y}$ and $\mathbf{t}$.
- edges: each ( $x \mathbf{y} z \mathbf{t}$ ) pair from pairs in $S$ that forms an edge.
- The algorithm looks for the connected component starting from an arbitrary vertex yo that the algorithm starts with.

## 3-round Attack on Feistel Networks

input: The set $S$ that consists of ( $\mathrm{X}_{\mathrm{k}} \mathrm{y}_{\mathrm{k}} \mathrm{Z}_{\mathrm{k}} \mathrm{t}_{\mathrm{k}}$ ) pairs.

- Model the set $S$ as a bipartite graph:
- vertices: two parties of $N$ values of all possible $\mathbf{y}$ and $\mathbf{t}$.
- edges: each ( $x \mathbf{y} z \mathbf{t}$ ) pair from pairs in $S$ that forms an edge.
- The algorithm looks for the connected component starting from an arbitrary vertex yo that the algorithm starts with.

## 3-round Attack on Feistel Networks

input: The set $S$ that consists of ( $\mathrm{X}_{\mathrm{k}} \mathrm{y}_{\mathrm{k}} \mathrm{Z}_{\mathrm{k}} \mathrm{t}_{\mathrm{k}}$ ) pairs.

- Model the set $S$ as a bipartite graph:
- vertices: two parties of $N$ values of all possible $\mathbf{y}$ and $\mathbf{t}$.
- edges: each ( $x \mathbf{y} z \mathbf{t}$ ) pair from pairs in $S$ that forms an edge.
- The algorithm looks for the connected component starting from an arbitrary vertex yo that the algorithm starts with.

## 3-round Attack on Feistel Networks

input: The set $S$ that consists of ( $\mathrm{X}_{\mathrm{k}} \mathrm{y}_{\mathrm{k}} \mathrm{Z}_{\mathrm{k}} \mathrm{t}_{\mathrm{k}}$ ) pairs.

- Model the set $S$ as a bipartite graph:
- vertices: two parties of $N$ values of all possible $\mathbf{y}$ and $\mathbf{t}$.
- edges: each ( $x \mathbf{y} z \mathbf{t}$ ) pair from pairs in $S$ that forms an edge.
- The algorithm looks for the connected component starting from an arbitrary vertex yo that the algorithm starts with.
- The graph is fully connected if the size of $S$ is $N \ln N$.
- The graph has a giant connected component if the size of $S$ is $N$

## Experimental Results

Let $|S|=\theta N$.
thin: The fraction of recovered $\mathrm{F}_{0}$ depending on $\theta$.
thick: The fraction of experiments which fully recovers all functions over 10,000 independent runs.

## The Principle of 4-round Attack on Feistel Networks

- If we characterize $F_{0}$, then we can find intermediate c values.
- If enough intermediate c values are known, we can run our 3-round attack.
- Again: We can set an output of Fo on an arbitrary point.

## Experimental Results

Results with $L=3$ and $M \approx N^{\frac{3}{2}}(N)^{\frac{1}{2 L}}$

| $\mathbf{N}$ | $\mathbf{M}$ | \#trials | Pr[succ] |
| :---: | :---: | :---: | :---: |
| 4 | 9 | 3864 | $3.60 \%$ |
| 8 | 29 | 5791 | $29.11 \%$ |
| 16 | 91 | 6585 | $49.83 \%$ |
| 32 | 288 | 6814 | $62.91 \%$ |
| 64 | 913 | 6981 | $73.80 \%$ |
| 128 | 2897 | 6609 | $83.10 \%$ |
| 256 | 9196 | 3154 | $89.22 \%$ |
| 512 | 29193 | 212 | $92.45 \%$ |

$\mathbf{N}$ : the domain size to a round function.
$\mathbf{M}$ : query complexity with a parameter $\mathbf{L}$.
trials: independent runs of the attack.
succ: entire round functions have been recovered.

| 64 | 913 | 2 | 1826 | 10000 | $54.14 \%$ |
| 128 | 2897 | 2 | 5794 | 10000 | $56.85 \%$ |
| 256 | 9196 | 2 | 18392 | 5098 | $56.34 \%$ |
| 512 | 29193 | 3 | 58386 | 256 | $77.73 \%$ |

$\mathbf{N}$ : the domain size to a round function.
$\mathbf{M}$ : the query complexity of 4-round attack with a parameter $\mathbf{L}$.
A: the number of arbitrary plaintext to apply chain encryption.
B: the length of the chain encryption.

## Conclusions

- Feistel Networks over small domains are not well understood yet.
- We need more research for generic attacks on Feistel networks.

## Conclusions

- Feistel Networks over small domains are not well understood yet.
- We need more research for generic attacks on Feistel networks.
- FF3 suffers from very bad domain separation.
- Fix to prevent from this attack: concatenate the tweak and round index.

## Thank You!

## Security of Feistel Networks

```
    r : round numbers
q}: number of queried plaintex
N
```

Security Proofs: [Patarin'10] proved that

- No distinguisher exists with $q \ll N$ known plaintext when $r \geq 4$.
- No distinguisher exists with $q \ll N$ chosen plaintext when $r \geq 5$.
- No distinguisher exists with $q \ll N$ chosen plaintext/ciphertext $r \geq 6$.
- If no distinguisher is possible, no other attack is possible either.

Information theory: The adversary needs $q=\frac{r}{2} N$ known plaintext to recover all the round functions.

Trivial attack: When the adversary knows the encryption of $q=N^{2}$ plaintext, it obtains the entire codebook for any $r$.

## Warm Up: 2-round Feistel Networks

$\mathrm{F}_{0}, \mathrm{~F}_{1}$ are round functions.
$x \| y \in \mathbb{Z}_{N} \times \mathbb{Z}_{N}$, so is $z \| t$.
$z=x+F_{0}(y)$
$t=y+F_{1}(z)$

- N2 known-plaintext attack is trivial.
- Can we figure out a round-function-recovery with less than N2 known-plaintext?
- Each known plaintext/ciphertext gives a point in round functions.
- Since we know $x$ and $z$, it is easy to derive $F_{0}(y)=z-x$.
- We simply compute $F_{1}(z)=t-y$.
- $N\left(\right.$ when $\left.N \ll N^{2}\right)$ known plaintext recovers the all the round functions with good probability.

## The Principle of 4-round Attack on Feistel Networks

## The Principle of 4-round Attack on Feistel Networks

## The Principle of 4-round Attack on Feistel Networks

Property: If $c=c^{\prime}$, then $x-x^{\prime}=\mathrm{F}_{0}\left(y^{\prime}\right)-\mathrm{F}_{0}(y)$

## The Principle of 4-round Attack on Feistel Networks

Property: If $c=c^{\prime}$, then $x-x^{\prime}=\mathrm{F}_{0}\left(y^{\prime}\right)-\mathrm{F}_{0}(y)$

## The Principle of 4-round Attack on Feistel Networks

$$
V=\left\{\left(x y z t, x^{\prime} y^{\prime} z^{\prime} t^{\prime}\right) \mid z^{\prime}=z, t^{\prime}-y^{\prime}=t-y, x y \neq x^{\prime} y^{\prime}\right\}
$$

Problem: Adversary cannot check if $c=c^{\prime}$.
Property: If $c=c^{\prime}$, then $x-x^{\prime}=\mathrm{F}_{0}\left(y^{\prime}\right)-\mathrm{F}_{0}(y)$

## The Principle of 4-round Attack on Feistel Networks

$$
\begin{aligned}
& V=\left\{\left(x y z t, x^{\prime} y^{\prime} z^{\prime} t^{\prime}\right) \mid z^{\prime}=z, t^{\prime}-y^{\prime}=t-y, x y \neq x^{\prime} y^{\prime}\right\} \\
& V_{\text {good }}=\left\{\left(x y z t, x^{\prime} y^{\prime} z^{\prime} t^{\prime}\right) \mid z^{\prime}=z, c^{\prime}=c, x y \neq x^{\prime} y^{\prime}\right\} \subseteq V
\end{aligned}
$$

Problem: Adversary cannot check if $c=c^{\prime}$.
Property: If $c=c^{\prime}$, then $x-x^{\prime}=\mathrm{F}_{0}\left(y^{\prime}\right)-\mathrm{F}_{0}(y)$

## The Principle of 4-round Attack on Feistel Networks

$$
\begin{aligned}
& V=\left\{\left(x y z t, x^{\prime} y^{\prime} z^{\prime} t^{\prime}\right) \mid z^{\prime}=z, t^{\prime}-y^{\prime}=t-y, x y \neq x^{\prime} y^{\prime}\right\} \\
& V_{\text {good }}=\left\{\left(x y z t, x^{\prime} y^{\prime} z^{\prime} t^{\prime}\right) \mid z^{\prime}=z, c^{\prime}=c, x y \neq x^{\prime} y^{\prime}\right\} \subseteq V
\end{aligned}
$$

Problem: Adversary cannot check if $c=c^{\prime}$.
Property: If $c=c^{\prime}$, then $x-x^{\prime}=\mathrm{F}_{0}\left(y^{\prime}\right)-\mathrm{F}_{0}(y)$
Define label $\left(x y z t, x^{\prime} y^{\prime} z^{\prime} t^{\prime}\right)=x-x^{\prime}$

## How to Identify Good Vertices?

Define a graph $G=(V, E)$ with

$$
E=\left\{x_{1} y_{1} z_{1} t_{1} x_{1}^{\prime} y_{1}^{\prime} z_{1}^{\prime} t_{1}^{\prime}, x_{2} y_{2} z_{2} t_{2} x_{2}^{\prime} y_{2}^{\prime} z_{2}^{\prime} t_{2}^{\prime} \mid y_{1}^{\prime}=y_{2}\right\}
$$

## How to Identify Good Vertices?

Define a graph $G=(V, E)$ with

$$
E=\left\{x_{1} y_{1} z_{1} t_{1} x_{1}^{\prime} y_{1}^{\prime} z_{1}^{\prime} t_{1}^{\prime}, x_{2} y_{2} z_{2} t_{2} x_{2}^{\prime} y_{2}^{\prime} z_{2}^{\prime} t_{2}^{\prime} \mid y_{1}^{\prime}=y_{2}\right\}
$$

Property: If $v_{1} v_{2} \ldots v_{L}$ is a cycle with all $v_{i}$ in $V_{\text {good, }}$, then

$$
\sum_{i=1}^{L} \operatorname{label}\left(v_{i}\right)=0
$$

## How to Identify Good Vertices?

Define a graph $G=(V, E)$ with

$$
E=\left\{x_{1} y_{1} z_{1} t_{1} x_{1}^{\prime} y_{1}^{\prime} z_{1}^{\prime} t_{1}^{\prime}, x_{2} y_{2} z_{2} t_{2} x_{2}^{\prime} y_{2}^{\prime} z_{2}^{\prime} t_{2}^{\prime} \mid y_{1}^{\prime}=y_{2}\right\}
$$

Property: If $v_{1} v_{2} \ldots v_{L}$ is a cycle with all $v_{i}$ in $V_{g o o d,}$, then

$$
\sum_{i=1}^{L} \operatorname{label}\left(v_{i}\right)=0
$$

## How to Identify Good Vertices?

Define a graph $G=(V, E)$ with

$$
E=\left\{x_{1} y_{1} z_{1} t_{1} x_{1}^{\prime} y_{1}^{\prime} z_{1}^{\prime} t_{1}^{\prime}, x_{2} y_{2} z_{2} t_{2} x_{2}^{\prime} y_{2}^{\prime} z_{2}^{\prime} t_{2}^{\prime} \mid y_{1}^{\prime}=y_{2}\right\}
$$

Property: If $v_{1} v_{2} \ldots v_{L}$ is a cycle with all $v_{i}$ in $V_{g o o d,}$, then

$$
\sum_{i=1}^{L} \operatorname{label}\left(v_{i}\right)=0
$$

## How to Identify Good Vertices?

Lemma 1: For random $v=x y z t x^{\prime} y^{\prime} z^{\prime} t^{\prime}$ and $\mathrm{F}_{0}, \mathrm{~F}_{1}, \mathrm{~F}_{2}, \mathrm{~F}_{3}$,

$$
\operatorname{Pr}\left[v \in V_{\text {good }} \mid v \in V\right]=\frac{1-\frac{1}{N}}{2-\frac{1}{N}} \approx \frac{1}{2}
$$

Lemma 2:
$\operatorname{Pr}\left[v_{1} v_{2} \in V_{\text {good }} \mid v_{1} v_{2}\right.$ non trivial cycle, $\sum_{i=1}^{2}$ label $\left.\left(v_{i}\right)=0\right] \geq \frac{1}{1+\frac{10}{N-5}}$
trivial cycle: $\mathrm{v}_{1}$ and $\mathrm{v}_{2}$ are permutation of each other

## Conjecture:

$$
\operatorname{Pr}\left[v_{1} \ldots v_{L} \in V_{\text {good }} \mid v_{1} \ldots v_{L} \text { acceptable cycle, } \sum_{i=1}^{L} \text { label }\left(v_{i}\right)=0\right] \approx 1
$$

acceptable cycle: with 2L non-repeating plaintexts.

## Chosen Plaintext Attack on FF3

- Let $C_{i^{\prime}}^{i}$ be the cycle spanned by $x y_{0,}^{i}$ with $T$.
- Let $\bar{C}^{i}$ be the cycle spanned by $\overline{x y}_{0}^{i}$ with $T \oplus(4,4)$.
- $\operatorname{Pr}\left(x y_{0}^{i}\right.$ and $\overline{x y} i_{0}^{i}$ in the same cycle (of any length) $) \approx \frac{1}{2}$.
- E (length $\left(C^{i}\right) \mid x y_{0}^{i}$ and $\overline{x y} i_{0}^{i^{\prime}}$ in the same cycle $) \approx \frac{2 N^{2}}{3}$.
- $\operatorname{Pr}$ ( two segments of length $B$ defined with $x y_{0}^{i}$ and $\overline{x y}_{0}^{i}$ overlap on at least $M$ points) $\approx \frac{2(B-M)}{N^{2}}$.
- $\operatorname{Pr}\left(\right.$ no such $i$ and $i^{\prime}$ exist $) \approx e^{\frac{-2 M A^{2}}{N^{2}}}$ when $B=2 M$.
- We derive $B=2 M$ and $A=\frac{N}{\sqrt{2 M}}$.
